

EXPERIMENT 16

Create a Static Website and Containerize, Build & Serve it using Docker.

Tasks:

- 1. Create a Simple Static Website (index.html file) with basic HTML content.**
- 2. Write/create a Dockerfile to serve the website using Nginx.**
- 3. Build the Docker Image**
- 4. Run the container:**
- 5. Access the Website using a Browser**

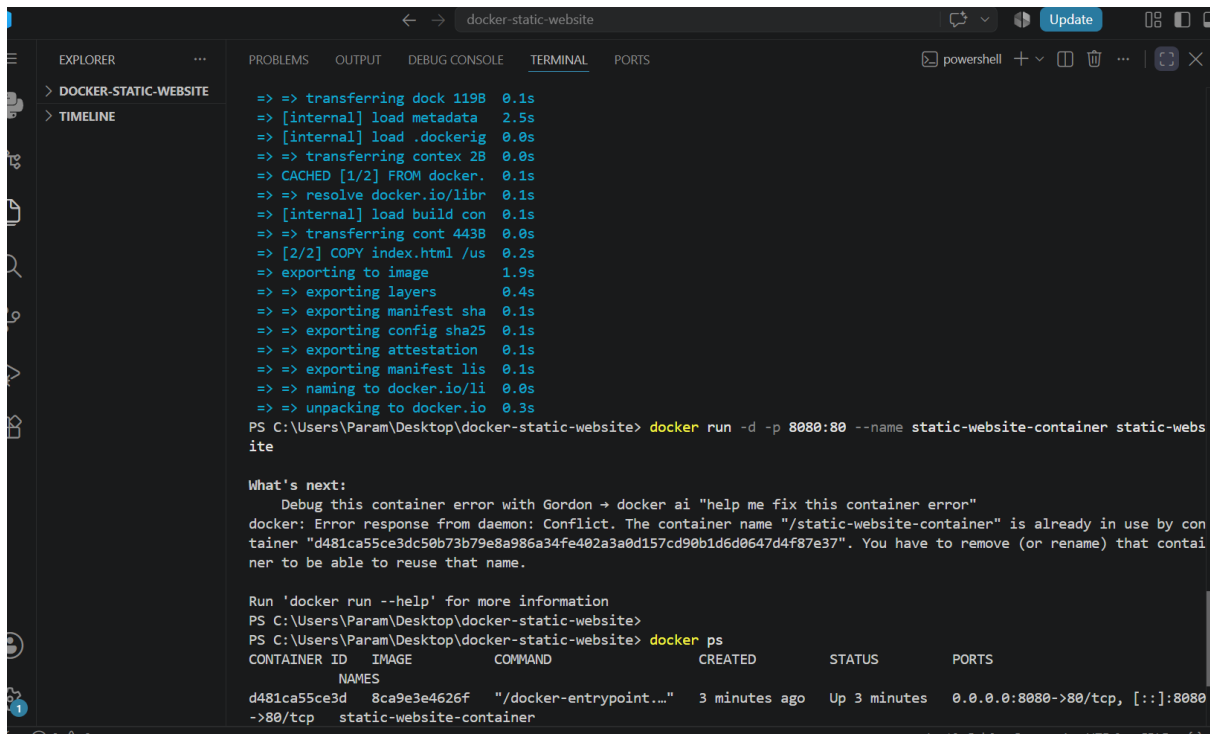

The screenshot shows the Visual Studio Code interface with a project named 'docker-static-website'. The Explorer panel on the left shows the project structure with 'DOCKER-STATIC-WEBSITE' and 'TIMELINE'. The main editor displays 'INDEX.HTML' with the following content:

```
1 <!DOCTYPE html>
2 <html>
3 <head>
4   <title>Docker Static Website</title>
5 </head>
```

The Dockerfile.txt is also visible in the editor. The TERMINAL panel at the bottom shows the following commands and output:

```
=> => exporting config sha25  0.1s
=> => exporting attestation  0.0s
=> => exporting manifest lis  0.0s
=> => naming to docker.io/li  0.0s
=> => unpacking to docker.io 0.1s
PS C:\Users\Param\Desktop\docker-static-website> docker run -d -p 8080:80 --name static-website-container static-website

PS C:\Users\Param\Desktop\docker-static-website> docker run -d -p 8080:80 --name static-website-container static-webs
ite

What's next:
  Debug this container error with Gordon → docker ai "help me fix this container error"
docker: Error response from daemon: Conflict. The container name "/static-website-container" is already in use by con
tainer "d481ca55ce3dc50b73b79e8a986a34fe402a3a0d157cd90b1d6d0647d4f87e37". You have to remove (or rename) that contai
ner to be able to reuse that name.

Run 'docker run --help' for more information
