

Implement Continuous Deployment using GitHub Actions to deploy a Dockerized application.

Tasks:

1. Set up a GitHub repository and push a simple Dockerized application.
2. Create a GitHub Actions workflow to automatically build and push the Docker image to Docker Hub or GitHub Container Registry.
3. Automate deployment to a cloud platform (e.g., AWS ECS, Azure Kubernetes Service, or Google Kubernetes Engine).
4. Test the CI/CD pipeline by pushing new code changes and verifying that the deployment occurs automatically.
